

PM-Ammo has recently embarked on a mission to provide new automated capabilities and tools to our Ammunition Managers. The project is called Supported Unit Ammunition Module (SUAM). During the project we will attempt to deliver a useful tool to the operating forces which will give our Ammunition Managers the ability to maintain visibility of ammunition assets once they leave supporting activities (ASPs/FASPs), identify responsible units, track the chain of custody, and streamline reporting requirements. The project is in the beginning stages and PM-Ammo personnel are soliciting comments and recommendations from the operating forces. The input provided by our community will assist in identifying requirements for this new operating system. The goal is to provide Ammunition Managers at all echelons common automated tools to enable a broad range of ammunition management functions that are not currently available with the our ammunition accounting systems.
